

PPN Practice Network Assignments

This information is for the practice's designated technical support resource. As it contains the Private Physician Network (the "PPN") assignment information uniquely assigned to each practice, they will use it when configuring the practice network to connect the PPN. This information should be kept private and secure for future reference.

Note: The information in this document does not apply to practices connecting to the PPN through a gateway at their local Health Authority (including Northern Health Physician Connect Network and Vancouver Coastal Health's Diamond Centre). These practices should, instead, refer to the ***"PPN Health Authority Gateway Primer"*** and dialogue directly with their Health Authority.

Complete details on the Private Physician Network are available on the PITO website at www.pito.bc.ca

Overview

Network assignment information, unique to your practice, is provided at the time of the PPN installation. This information includes:

- PPN Router Identification: A “CSID” number assigned by TELUS, which uniquely identifies the router equipment installed at your practice. The CSID number must be passed along to your practice’s EMR vendor, as it must be provided whenever they report a problem through to the TELUS help desk.
- PPN IP Addresses: The unique PPN IP address information assigned to your practice is provided below. It must be passed along to your practice’s technical support resource who will use it to configure and connect the practice network to the PPN.

Note: Your practice’s technical support resource must also refer to the PPN Technical Reference document (sent directly to the lead practice contact), for general technical information for preparing, configuring and connecting the practice network to the PPN.

This network assignment information should be saved in a secure manner for future reference. Should you have any questions, please contact your EMR vendor helpdesk which is your first point of contact for technical assistance.
